

Meditech IT Clinic System (MIT)

Providing practical IT solutions for the new NHS

Meditech IT Clinic System (MIT)

Meditech IT Clinic System (MIT) is a purpose built software package developed by RSLSTEEPER. In constant development by clinicians since 1991, it is one of the most advanced yet user-friendly and clinician-focused management systems available to NHS Trust customers.

It is specifically designed for the clinical, financial and management requirements of NHS Rehabilitation Units and allied disciplines.

Patient Benefits

MIT provides complete real-time management of patient details, including medical notes and episodes of care, as well as a wide range of demographic options.

Benefits include:

- 'One patient, one record' concept, meaning a patient's entire clinical and financial history, across several rehabilitation disciplines, can be recorded in one place.
- The ability to record Frenchay, Barthel and SIGAM test scores, allowing treatment to be focused in the most effective areas.
- A centralised letter library, allowing users to create correspondence using patient specific details. This speeds up communication between patients and staff and leads to greater accuracy and a better overall package of care.

“Providing practical IT solutions
for the new NHS”

Increased efficiency

MIT's multi-discipline appointment system allows users to search several diaries simultaneously. This facilitates a better management of resources, reducing patient visits and leading to a reduction of costs for related services such as transport.

Meditech IT is designed as a Whole Process System. This means that the single software package can often do the tasks which currently need three or four separate packages to perform, thus greatly reducing expenditure on both software licenses/support and staff training. The package is supplied as a fully managed system, removing the need for costly support staff and major capital outlay.

Flexibility in Integration

MIT has also been developed to handle order and invoice processing, job costing and stock control, and is compatible with SBS invoice processing and data export. It includes audit facilities to give greater accountability and assist in clinical governance and evidence based practise.

MIT can be integrated with NHS systems, and only requires a Windows platform to run. All future software updates are included within the license and we can bespoke your requirements into the application, guaranteeing the ongoing compatibility of your system and minimising both future expenditure and disruption.

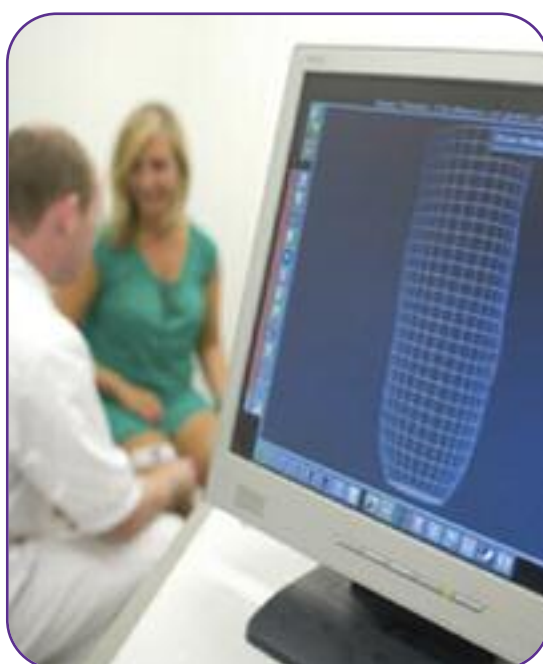

Technically Superior

The package connects to the N3 network via a dedicated NHS gateway, enabling access from anywhere on N3. Subject to access list.

All Meditech IT servers are located in Category 1 security facilities, the most secure available. RSLSTEEPER holds certification for ISO27001 and ISO9001 TickIT, which are internationally recognised standards for information security management and quality assurance.
